

1.2 - Cloud computing Quiz (New) :-

- 10) A company hosts its website on servers in its own data center. Traffic is expected to grow tenfold next month. What is the main limitation of this traditional IT approach?
- a) The servers cannot be reached by clients over the Internet
 - b) Each server can only hold one IP address at a time
 - ☒ c) New servers must be ordered, installed & powered in advance, so scaling is slow and limited
 - d) Router cannot forward traffic to more than one server
- 20) A company, used to buy servers based on yearly forecasts, often ending up with too much or too little capacity. On AWS, it now adds & removes resources based on actual usage. Which advantage of cloud computing does this illustrate?
- ☒ a) Stop guessing capacity
 - b) Benefit from massive economic of scale
 - c) Go global in minutes
 - d) Trade capital expenses for operational expense
- 30) A development team wants to deploy its web application on AWS and manage only its application code and data without managing the operating system, runtime or servers. Which type of cloud computing fits best?
- a) IaaS, such as EC2
 - ☒ b) PaaS, such as AWS Elastic Beanstalk
 - c) SaaS, such as Amazon Rekognition
 - d) Hybrid cloud, with some servers kept on premises
- 40) A company is launching an application for customers in France. Local regulations require that customer data stays within the country. Which factor drives company's choice of AWS region?
- a) latency to end users
 - b) Pricing of services in regions
 - c) Availability of services in regions
 - ☒ d) Compliance with data governance and legal requirements
- 50) In AWS management console, most services show currently selected region, but few show 'Global' instead. Which of following is Global service?
- a) Amazon EC2
 - b) AWS Lambda
 - ☒ c) Amazon Route 53
 - d) Amazon Rekognition

60) Under AWS Shared Responsibility Model, which task is customer's responsibility?

- a) physical security of AWS data centers
- b) Configuring firewall and network rules for its own resources
- c) maintaining hardware that runs AWS services
- d) securing AWS global network infrastructure
